## 1 Cross Ratio. Harmonic Conjugates. Perspectivity. Projectivity

Definition 1. Let $A, B, C$, and $D$ be colinear points. The cross ratio of the pairs of points $(A, B)$ and $(C, D)$ is

$$
\begin{equation*}
\mathcal{R}(A, B ; C, D)=\frac{\overrightarrow{A C}}{\overrightarrow{C B}}: \frac{\overrightarrow{A D}}{\overrightarrow{D B}} \tag{1}
\end{equation*}
$$

Let $a, b, c, d$ be four concurrent lines. For the given lines $p_{1}$ and $p_{2}$ let us denote $A_{i}=a \cap p_{i}$, $B_{i}=b \cap p_{i}, C_{i}=c \cap p_{i}, D_{i}=d \cap p_{i}$, for $i=1$, 2. Then

$$
\begin{equation*}
\mathcal{R}\left(A_{1}, B_{1} ; C_{1}, D_{1}\right)=\mathcal{R}\left(A_{2}, B_{2} ; C_{2}, D_{2}\right) . \tag{2}
\end{equation*}
$$

Thus it is meaningful to define the cross ratio of the pairs of concurrent points as

$$
\begin{equation*}
\mathcal{R}(a, b ; c, d)=\mathcal{R}\left(A_{1}, B_{1} ; C_{1}, D_{1}\right) . \tag{3}
\end{equation*}
$$

Assume that points $O_{1}, O_{2}, A, B, C, D$ belong to a circle. Then

$$
\begin{align*}
& \mathcal{R}\left(O_{1} A, O_{1} B ; O_{1} C, O_{1} D\right) \\
= & \mathcal{R}\left(O_{2} A, O_{2} B ; O_{2} C, O_{2} D\right) . \tag{4}
\end{align*}
$$

Hence it is meaningful to define the cross-ratio for cocyclic points as

$$
\begin{equation*}
\mathcal{R}(A, B ; C, D)=\mathcal{R}\left(O_{1} A, O_{1} B ; O_{1} C, O_{1} D\right) . \tag{5}
\end{equation*}
$$

Assume that the points $A, B, C, D$ are colinear or cocyclic. Let an inversion with center $O$ maps $A, B, C, D$ into $A^{*}, B^{*}, C^{*}, D^{*}$. Then

$$
\begin{equation*}
\mathcal{R}(A, B ; C, D)=\mathcal{R}\left(A^{*}, B^{*} ; C^{*}, D^{*}\right) \tag{6}
\end{equation*}
$$

Definition 2. Assume that $A, B, C$, and $D$ are cocyclic or colinear points. Pairs of points $(A, B)$ and $(C, D)$ are harmonic conjugates if $\mathcal{R}(A, B ; C, D)=-1$. We also write $\mathcal{H}(A, B ; C, D)$ when we want to say that $(A, B)$ and $(C, D)$ are harmonic conjugates to each other.

Definition 3. Let each of $l_{1}$ and $l_{2}$ be either line or circle. Perspectivity with respect to the point $S$ $\stackrel{S}{\pi}$, is the mapping of $l_{1} \rightarrow l_{2}$, such that
(i) If either $l_{1}$ or $l_{2}$ is a circle than it contains $S$;
(ii) every point $A_{1} \in l_{1}$ is mapped to the point $A_{2}=O A_{1} \cap l_{2}$.

According to the previous statements perspectivity preserves the cross ratio and hence the harmonic conjugates.

Definition 4. Let each of $l_{1}$ and $l_{2}$ be either line or circle. Projectivity is any mapping from $l_{1}$ to $l_{2}$ that can be represented as a finite composition of perspectivities.

Theorem 1. Assume that the points $A, B, C, D_{1}$, and $D_{2}$ are either colinear or cocyclic. If $\mathcal{R}\left(A, B ; C, D_{1}\right)=\mathcal{R}\left(A, B ; C, D_{2}\right)$, then $D_{1}=D_{2}$. In other words, a projectivity with three fixed points is the identity.
Theorem 2. If the points $A, B, C, D$ are mutually discjoint and $\mathcal{R}(A, B ; C, D)=\mathcal{R}(B, A ; C, D)$ then $\mathcal{H}(A, B ; C, D)$.

## 2 Desargue's Theorem

The triangles $A_{1} B_{1} C_{1}$ and $A_{2} B_{2} C_{2}$ are perspective with respect to a center if the lines $A_{1} A_{2}$, $B_{1} B_{2}$, and $C_{1} C_{2}$ are concurrent. They are perspective with respect to an axis if the points $K=$ $B_{1} C_{1} \cap B_{2} C_{2}, L=A_{1} C_{1} \cap A_{2} C_{2}, M=A_{1} B_{1} \cap A_{2} B_{2}$ are colinear.

Theorem 3 (Desargue). Two triangles are perspective with respect to a center if and only if they are perspective with respect to a point.

## 3 Theorems of Pappus and Pascal

Theorem 4 (Pappus). The points $A_{1}, A_{2}, A_{3}$ belong to the line $a$, and the points $B_{1}, B_{2}, B_{3}$ belong to the line $b$. Assume that $A_{1} B_{2} \cap A_{2} B_{1}=C_{3}, A_{1} B_{3} \cap A_{3} B_{1}=C_{2}, A_{2} B_{3} \cap A_{3} B_{2}=C_{1}$. Then $C_{1}, C_{2}, C_{3}$ are colinear.

Proof. Denote $C_{2}^{\prime}=C_{1} C_{3} \cap A_{3} B_{1}, D=A_{1} B_{2} \cap A_{3} B_{1}, E=A_{2} B_{1} \cap A_{3} B_{2}, F=a \cap b$. Our goal is to prove that the points $C_{2}$ and $C_{2}^{\prime}$ are identical. Consider the sequence of projectivities:

$$
A_{3} B_{1} D C_{2}{\underset{\pi}{A}}_{A_{1}}^{F} F B_{1} B_{2} B_{3} \stackrel{A_{2}}{\pi} \quad A_{3} E B_{2} C_{1} \stackrel{C_{3}}{\pi} A_{3} B_{1} D C_{2}^{\prime}
$$

We have got the projective transformation of the line $A_{3} B_{1}$ that fixes the points $A_{3}, B_{1}, D$, and maps $C_{2}$ to $C_{2}^{\prime}$. Since the projective mapping with three fixed points is the identity we have $C_{2}=C_{2}^{\prime}$.

Theorem 5 (Pascal). Assume that the points $A_{1}, A_{2}, A_{3}, B_{1}, B_{2}, B_{3}$ belong to a circle. The point in intersections of $A_{1} B_{2}$ with $A_{2} B_{1}, A_{1} B_{3}$ with $A_{3} B_{1}, A_{2} B_{3}$ with $A_{3} B_{2}$ lie on a line.

Proof. The points $C_{2}^{\prime}, D$, and $E$ as in the proof of the Pappus theorem. Consider the sequence of perspectivities

$$
A_{3} B_{1} D C_{2} \stackrel{A_{1}}{\pi} A_{3} B_{1} B_{2} B_{3}{ }_{\pi}^{A_{\pi}} \quad A_{3} E B_{2} C_{1} \stackrel{C_{3}}{\pi} A_{3} B_{1} D C_{2}^{\prime} .
$$

In the same way as above we conclude that $C_{2}=C_{2}^{\prime}$.

## 4 Pole. Polar. Theorems of Brianchon and Brokard

Definition 5. Given a circle $k(O, r)$, let $A^{*}$ be the image of the point $A \neq O$ under the inversion with respect to $k$. The line a passing through $A^{*}$ and perpendicular to $O A$ is called the polar of $A$ with respect to $k$. Conversely $A$ is called the pole of a with respect to $k$.

Theorem 6. Given a circle $k(O, r)$, let and $a$ and $b$ be the polars of $A$ and $B$ with respect to $k$. The $A \in b$ if and only if $B \in a$.

Proof. $A \in b$ if and only if $\angle A B^{*} O=90^{\circ}$. Analogously $B \in a$ if and only if $\angle B A^{*} O=90^{\circ}$, and it reamins to notice that according to the basic properties of inversion we have $\angle A B^{*} O=\angle B A^{*} O$.

Definition 6. Points $A$ and $B$ are called conjugated with respect to the circle $k$ if one of them lies on a polar of the other.

Theorem 7. If the line determined by two conjugated points $A$ and $B$ intersects $k(O, r)$ at $C$ and $D$, then $\mathcal{H}(A, B ; C, D)$. Conversely if $\mathcal{H}(A, B ; C, D)$, where $C, D \in k$ then $A$ and $B$ are conjugated with respect to $k$.

Proof. Let $C_{1}$ and $D_{1}$ be the intersection points of $O A$ with $k$. Since the inversion preserves the cross-ratio and $\mathcal{R}\left(C_{1}, D_{1} ; A, A^{*}\right)=\mathcal{R}\left(C_{1}, D_{1} ; A^{*}, A\right)$ we have

$$
\begin{equation*}
\mathcal{H}\left(C_{1}, D_{1} ; A, A^{*}\right) \tag{7}
\end{equation*}
$$

Let $p$ be the line that contains $A$ and intersects $k$ at $C$ and $D$. Let $E=C C_{1} \cap D D_{1}, F=C D_{1} \cap D C_{1}$. Since $C_{1} D_{1}$ is the diameter of $k$ we have $C_{1} F \perp D_{1} E$ and $D_{1} F \perp C_{1} E$, hence $F$ is the orthocenter of the triangle $C_{1} D_{1} E$. Let $B=E F \cap C D$ and $\bar{A}^{*}=E F \cap C_{1} D_{1}$. Since

$$
C_{1} D_{1} A \bar{A}^{*} \stackrel{E}{\pi} C D A B \stackrel{F}{\bar{\pi}} D_{1} C_{1} A \bar{A}^{*}
$$

have $\mathcal{H}\left(C_{1}, D_{1} ; A, \bar{A}^{*}\right)$ and $\mathcal{H}(C, D ; A, B)$. (7) now implies two facts:
$1^{\circ}$ From $\mathcal{H}\left(C_{1}, D_{1} ; A, \bar{A}^{*}\right)$ and $\mathcal{H}\left(C_{1}, D_{1} ; A, A^{*}\right)$ we get $A^{*}=\bar{A}^{*}$, hence $A^{*} \in E F$. However, since $E F \perp C_{1} D_{1}$, the line $E F=a$ is the polar of $A$.
$2^{\circ}$ For the point $B$ which belongs to the polar of $A$ we have $\mathcal{H}(C, D ; A, B)$. This completes the proof.

Theorem 8 (Brianchon's theorem). Assume that the hexagon $A_{1} A_{2} A_{3} A_{4} A_{5} A_{6}$ is circumscribed about the circle $k$. The lines $A_{1} A_{4}, A_{2} A_{5}$, and $A_{3} A_{6}$ intersect at a point.

Proof. We will use the convention in which the points will be denoted by capital latin letters, and their repsective polars with the corresponding lowercase letters.

Denote by $M_{i}, i=1,2, \ldots, 6$, the points of tangency of $A_{i} A_{i+1}$ with $k$. Since $m_{i}=A_{i} A_{i+1}$, we have $M_{i} \in a_{i}, M_{i} \in a_{i+1}$, hence $a_{i}=M_{i-1} M_{i}$.

Let $b_{j}=A_{j} A_{j+3}, j=1,2,3$. Then $B_{j}=a_{j} \cap a_{j+3}=M_{j-1} M_{j} \cap M_{j+3} M_{j+4}$. We have to prove that there exists a point $P$ such that $P \in b_{1}, b_{2}, b_{3}$, or analogously, that there is a line $p$ such that $B_{1}, B_{2}, B_{3} \in p$. In other words we have to prove that the points $B_{1}, B_{2}, B_{3}$ are colinear. However this immediately follows from the Pascal's theorem applied to $M_{1} M_{3} M_{5} M_{4} M_{6} M_{2}$.

From the previous proof we see that the Brianchon's theorem is obtained from the Pascal's by replacing all the points with their polars and all lines by theirs poles.

Theorem 9 (Brokard). The quadrilateral $A B C D$ is inscribed in the circle $k$ with center $O$. Let $E=A B \cap C D, F=A D \cap B C, G=A C \cap B D$. Then $O$ is the orthocenter of the triangle $E F G$.

Proof. We will prove that $E G$ is a polar of $F$. Let $X=E G \cap B C$ and $Y=E G \cap A D$. Then we also have

$$
A D Y F \stackrel{E}{\pi} B C X F \stackrel{G}{\pi} D A Y F,
$$

which implies the relations $\mathcal{H}(A, D ; Y, F)$ and $\mathcal{H}(B, C ; X, F)$. According to the properties of polar we have that the points $X$ and $Y$ lie on a polar of the point $F$, hence $E G$ is a polar of the point $F$.

Since $E G$ is a polar of $F$, we have $E G \perp O F$. Analogously we have $F G \perp O E$, thus $O$ is the orthocenter of $\triangle E F G$.

## 5 Problems

1. Given a quadrilateral $A B C D$, let $P=A B \cap C D, Q=A D \cap B C, R=A C \cap P Q$, $S=B D \cap P Q$. Prove that $\mathcal{H}(P, Q ; R, S)$.
2. Given a triangle $A B C$ and a point $M$ on $B C$, let $N$ be the point of the line $B C$ such that $\angle M A N=90^{\circ}$. Prove that $\mathcal{H}(B, C ; M, N)$ if and only if $A M$ is the bisector of the angle $\angle B A C$.
3. Let $A$ and $B$ be two points and let $C$ be the point of the line $A B$. Using just a ruler find a point $D$ on the line $A B$ such that $\mathcal{H}(A, B ; C, D)$.
4. Let $A, B, C$ be the diagonal points of the quadrilateral $P Q R S$, or equivalently $A=P Q \cap R S$, $B=Q R \cap S P, C=P R \cap Q S$. If only the points $A, B, C, S$, are given using just a ruler construct the points $P, Q, R$.
5. Assume that the incircle of $\triangle A B C$ touches the sides $B C, A C$, and $A B$ at $D, E$, and $F$. Let $M$ be the point such that the circle $k_{1}$ incscibed in $\triangle B C M$ touches $B C$ at $D$, and the sides $B M$ and $C M$ at $P$ and $Q$. Prove that the lines $E F, P Q, B C$ are concurrent.
6. Given a triangle $A B C$, let $D$ and $E$ be the points on $B C$ such that $B D=D E=E C$. The line $p$ intersects $A B, A D, A E, A C$ at $K, L, M, N$, respectively. Prove that $K N \geq 3 L M$.
7. The point $M_{1}$ belongs to the side $A B$ of the quadrilateral $A B C D$. Let $M_{2}$ be the projection of $M_{1}$ to the line $B C$ from $D, M_{3}$ projection of $M_{2}$ to $C D$ from $A, M_{4}$ projection of $M_{3}$ to $D A$ from $B, M_{5}$ projection of $M_{4}$ to $A B$ from $C$, etc. Prove that $M_{13}=M_{1}$.
8. (butterfly theorem) Points $M$ and $N$ belong to the circle $k$. Let $P$ be the midpoint of the chord $M N$, and let $A B$ and $C D(A$ and $C$ are on the same side of $M N)$ be arbitrary chords of $k$ passing through $P$. Prove that lines $A D$ and $B C$ intersect $M N$ at points that are equidistant from $P$.
9. Given a triangle $A B C$, let $D$ and $E$ be the points of the sides $A B$ and $A C$ respectively such that $D E \| B C$. Let $P$ be an interior point of the triangle $A D E$. Assume that the lines $B P$ and $C P$ intersect $D E$ at $F$ and $G$ respectively. The circumcircles of $\triangle P D G$ and $\triangle P F E$ intersect at $\operatorname{Pand} Q$. Prove that the points $A, P$, and $Q$ are colinear.
10. (IMO 1997 shortlist) Let $A_{1} A_{2} A_{3}$ be a non-isosceles triangle with the incenter $I$. Let $C_{i}$, $i=1,2,3$, be the smaller circle through $I$ tangent to both $A_{i} A_{i+1}$ and $A_{i} A_{i+2}$ (summation of indeces is done modulus 3). Let $B_{i}, i=1,2,3$, be the other intersection point of $C_{i+1}$ and $C_{i+2}$. Prove that the circumcenters of the triangles $A_{1} B_{1} I, A_{2} B_{2} I, A_{3} B_{3} I$ are colinear.
11. Given a triangle $A B C$ and a point $T$, let $P$ and $Q$ be the feet of perpendiculars from $T$ to the lines $A B$ and $A C$, respectively. Let $R$ and $S$ be the feet of perpendiculars from $A$ to $T C$ and $T B$, respectively. Prove that the intersection of $P R$ and $Q S$ belongs to $B C$.
12. Given a triangle $A B C$ and a point $M$, a line passing through $M$ intersects $A B, B C$, and $C A$ at $C_{1}, A_{1}$, and $B_{1}$, respectively. The lines $A M, B M$, and $C M$ intersect the circumcircle of $\triangle A B C$ repsectively at $A_{2}, B_{2}$, and $C_{2}$. Prove that the lines $A_{1} A_{2}, B_{1} B_{2}$, and $C_{1} C_{2}$ intersect in a point that belongs to the circumcircle of $\triangle A B C$.
13. Let $P$ and $Q$ isogonaly conjugated points and assume that $\triangle P_{1} P_{2} P_{3}$ and $\triangle Q_{1} Q_{2} Q_{3}$ are their pedal triangles, respectively. Let $X_{1}=P_{2} Q_{3} \cap P_{3} Q_{2}, X_{2}=P_{1} Q_{3} \cap P_{3} Q_{1}, X_{3}=$ $P_{1} Q_{2} \cap P_{2} Q_{1}$. Prove that the points $X_{1}, X_{2}, X_{3}$ belong to the line $P Q$.
14. If the points $A$ and $M$ are conjugated with respect to $k$, then the circle with diameter $A M$ is orthogonal to $k$.
15. From a point $A$ in the exterior of a circle $k$ two tangents $A M$ and $A N$ are drawn. Assume that $K$ and $L$ are two points of $k$ such that $A, K, L$ are colinear. Prove that $M N$ bisects the segment $P Q$.
16. The point isogonaly conjugated to the centroid is called the Lemuan point. The lines connected the vertices with the Lemuan point are called symmedians. Assume that the tangents from $B$ and $C$ to the circumcircle $\Gamma$ of $\triangle A B C$ intersect at the point $P$. Prove that $A P$ is a symmedian of $\triangle A B C$.
17. Given a triangle $A B C$, assume that the incircle touches the sides $B C, C A, A B$ at the points $M, N, P$, respectively. Prove that $A M, B N$, and $C P$ intersect in a point.
18. Let $A B C D$ be a quadrilateral circumscribed about a circle. Let $M, N, P$, and $Q$ be the points of tangency of the incircle with the sides $A B, B C, C D$, and $D A$ respectively. Prove that the lines $A C, B D, M P$, and $N Q$ intersect in a point.
19. Let $A B C D$ be a cyclic quadrilateral whose diagonals $A C$ and $B D$ intersect at $O$; extensions of the sides $A B$ and $C D$ at $E$; the tangents to the circumcircle from $A$ and $D$ at $K$; and the tangents to the circumcircle at $B$ and $C$ at $L$. Prove that the points $E, K, O$, and $L$ lie on a line.
20. Let $A B C D$ be a cyclic quadrilateral. The lines $A B$ and $C D$ intersect at the point $E$, and the diagonals $A C$ and $B D$ at the point $F$. The circumcircle of the triangles $\triangle A F D$ and $\triangle B F C$ intersect again at $H$. Prove that $\angle E H F=90^{\circ}$.

## 6 Solutions

1. Let $T=A C \cap B D$. Consider the sequence of the perspectivities

$$
P Q R S \stackrel{A}{\bar{\pi}} B D T S \stackrel{C}{\bar{\pi}} Q P R S .
$$

Since the perspectivites preserves the cross-ratio $\mathcal{R}(P, Q ; R, S)=\mathcal{R}(Q, P ; R, S)$ implying $\mathcal{H}(P, Q ; R, S)$.
2. Let $\alpha=\angle B A C, \beta=\angle C B A, \gamma=\angle A C B$ and $\varphi=\angle B A M$. Using the sine theorem on $\triangle A B M$ and $\triangle A C M$ we get

$$
\frac{B M}{M C}=\frac{B M}{A M} \frac{A M}{C M}=\frac{\sin \varphi}{\sin \beta} \frac{\sin \gamma}{\sin (\alpha-\varphi)}
$$

Similarly using the sine theorem on $\triangle A B N$ and $\triangle A C N$ we get

$$
\frac{B N}{N C}=\frac{B N}{A N} \frac{A N}{C N}=\frac{\sin \left(90^{\circ}-\varphi\right)}{\sin \left(180^{\circ}-\beta\right)} \frac{\sin \gamma}{\sin \left(90^{\circ}+\alpha-\varphi\right)}
$$

Combining the previous two equations we get

$$
\frac{B M}{M C}: \frac{B N}{N C}=\frac{\tan \varphi}{\tan (\alpha-\varphi)}
$$

Hence, $|\mathcal{R}(B, C ; M, N)|=1$ is equivalent to $\tan \varphi=\tan (\alpha-\varphi)$, i.e. to $\varphi=\alpha / 2$. Since $B \neq C$ and $M \neq N$, the relation $|\mathcal{R}(B, C ; M, N)|=1$ is equivalent to $\mathcal{R}(B, C ; M, N)=$ -1 , and the statement is now shown.
3. The motivation is the problem 1. Choose a point $K$ outside $A B$ and point $L$ on $A K$ different from $A$ and $K$. Let $M=B L \cap C K$ and $N=B K \cap A M$. Now let us construct a point $D$ as $D=A B \cap L N$. From the problem 1 we indeed have $\mathcal{H}(A, B ; C, D)$.
4. Let us denote $D=A S \cap B C$. According to the problem 1 we have $\mathcal{H}(R, S ; A, D)$. Now we construct the point $D=A S \cap B C$. We have the points $A, D$, and $S$, hence according to the previous problem we can construct a point $R$ such that $\mathcal{H}(A, D ; S, R)$. Now we construct $P=B S \cap C R$ and $Q=C S \cap B R$, which solves the problem.
5. It is well known (and is easy to prove using Ceva's theorem) that the lines $A D, B E$, and $C F$ intersect at a point $G$ (called a Gergonne point of $\triangle A B C)$ Let $X=B C \cap E F$. As in the problem 1 we have $\mathcal{H}(B, C ; D, X)$. If we denote $X^{\prime}=B C \cap P Q$ we analogously have $\mathcal{H}\left(B, C ; D, X^{\prime}\right)$, hence $X=X^{\prime}$.
6. Let us denote $x=K L, y=L M, z=M N$. We have to prove that $x+y+z \geq 3 y$, or equivalently $x+z \geq 2 y$. Since $\mathcal{R}(K, N ; L, M)=\mathcal{R}(B, C ; D, E)$, we have

$$
\frac{x}{y+z}: \frac{x+y}{z}=\frac{\overrightarrow{K L}}{\overrightarrow{L N}}: \frac{\overrightarrow{K M}}{\overrightarrow{M N}}=\frac{\overrightarrow{B D}}{\overrightarrow{D C}}: \frac{\overrightarrow{B E}}{\overrightarrow{E C}}=\frac{1}{2}: \frac{1}{2},
$$

implying $4 x z=(x+y)(y+z)$.
If it were $y>(x+z) / 2$ we would have

$$
x+y>\frac{3}{2} x+\frac{1}{2} z=2 \frac{1}{4}(x+x+x+z) \geq 2 \sqrt[4]{x x x z}
$$

and analogously $y+z>2 \sqrt[4]{x z z z}$ as well as $(x+y)(y+z)>4 x z$ which is a contradiction. Hence the assumption $y>(x+z) / 2$ was false so we have $y \leq(x+z) / 2$.
Let us analyze the case of equality. If $y=(x+z) / 2$, then $4 x z=(x+y)(x+z)=$ $(3 x+z)(x+3 z) / 4$, which is equivalent to $(x-z)^{2}=0$. Hence the equality holds if $x=y=z$. We leave to the reader to prove that $x=y=z$ is satisfied if and only if $p \| B C$.
7. Let $E=A B \cap C D, F=A D \cap B C$. Consider the sequence of perspectivities

$$
\begin{equation*}
A B E M_{1} \stackrel{D}{\pi} F B C M_{2} \stackrel{A}{\pi} D E C M_{3} \stackrel{B}{\pi} D A F M_{4} \stackrel{C}{\pi} E A B M_{5} . \tag{8}
\end{equation*}
$$

According to the conditions given in the problem this sequence of perspectivites has two be applied three more times to arrive to the point $M_{13}$. Notice that the given sequence of perspectivities maps $A$ to $E, E$ to $B$, and $B$ to $A$. Clearly if we apply (8) three times the points $A, B$, and $E$ will be fixed while $M_{1}$ will be mapped to $M_{13}$. Thus $M_{1}=M_{13}$.
8. Let $X^{\prime}$ be the point symmetric to $Y$ with respect to $P$. Notice that

$$
\begin{aligned}
& \mathcal{R}(M, N ; X, P)=\mathcal{R}(M, N ; P, Y) \quad \text { (from } M N X P \stackrel{D}{\hbar} M N A C \stackrel{B}{\hbar} M N P Y) \\
&=\mathcal{R}\left(N, M ; P, X^{\prime}\right) \quad \text { (the reflection with the center } P \text { preserves } \\
& \text { the ratio, hence it preserves the cross-ratio) } \\
&=\frac{1}{\mathcal{R}\left(N, M ; X^{\prime}, P\right)}=\mathcal{R}\left(M, N ; X^{\prime}, P\right),
\end{aligned}
$$

where the last equality follows from the basic properties of the cross ratio. It follows that $X=X^{\prime}$.
9. Let $J=D Q \cap B P, K=E Q \cap C P$. If we prove that $J K \| D E$ this would imply that the triangles $B D J$ and $C E K$ are perspective with the respect to a center, hence with repsect to an axis as well (according to Desargue's theorem) which immediately implies that $A, P, Q$ are colinear (we encourage the reader to verify this fact).
Now we will prove that $J K \| D E$. Let us denote $T=D E \cap P Q$. Applying the Menelaus theorem on the triangle $D T Q$ and the line $P F$ we get

$$
\frac{\overrightarrow{D J}}{\overrightarrow{J Q}} \overrightarrow{\overrightarrow{Q P}} \frac{\overrightarrow{P P}}{\overrightarrow{F D}}=-1
$$

Similarly from the triangle $E T Q$ and the line $P G$ :

$$
\frac{\overrightarrow{E K}}{\overrightarrow{K Q}} \stackrel{\overrightarrow{Q P}}{\overrightarrow{P T}} \frac{\overrightarrow{T G}}{\overrightarrow{G E}}=-1
$$

Dividing the last two equalities and using $D T \cdot T G=F T \cdot T E$ ( $T$ is on the radical axis of the circumcircles of $\triangle D P G$ and $\triangle F P E$ ), we get

$$
\frac{\overrightarrow{D J}}{\overrightarrow{J Q}}=\frac{\overrightarrow{E K}}{\overrightarrow{K Q}}
$$

Thus $J K \| D E$, q.e.d.
10. Apply the inversion with the respect to $I$. We leave to the reader to draw the inverse picture. Notice that the condition that $I$ is the incentar now reads that the circumcircles $A_{i}^{*} A_{i+1}^{*} I$ are of the same radii. Indeed if $R$ is the radius of the circle of inversion and $r$ the distance between $I$ and $X Y$ then the radius of the circumcircle of $\triangle I X^{*} Y^{*}$ is equal to $R^{2} / r$. Now we use the following statement that is very easy to prove: '"Let $k_{1}, k_{2}, k_{3}$ be three circles such that all
pass through the same point $I$, but no two of them are mutually tangent. Then the centers of these circles are colinear if and only if there exists another common point $J \neq I$ of these three circles."

In the inverse picture this transforms into proving that the lines $A_{1}^{*} B_{1}^{*}, A_{2}^{*} B_{2}^{*}$, and $A_{3}^{*} B_{3}^{*}$ intersect at a point.

In order to prove this it is enough to show that the corresponding sides of the triangles $A_{1}^{*} A_{2}^{*} A_{3}^{*}$ and $B_{1}^{*} B_{2}^{*} B_{3}^{*}$ are parallel (then these triangles would be perspective with respect to the infinitely far line). Afterwards the Desargue's theorem would imply that the triangles are perspective with respect to a center. Let $P_{i}^{*}$ be the incenter of $A_{i+1}^{*} A_{i+2}^{*} I$, and let $Q_{i}^{*}$ be the foot of the perpendicular from $I$ to $P_{i+1}^{*} P_{i+2}^{*}$. It is easy to prove that

$$
\overrightarrow{A_{1}^{*} A_{2}^{*}}=2 \overrightarrow{Q_{1}^{*} Q_{2}^{*}}=-\overrightarrow{P_{1}^{*} P_{2}^{*}}
$$

Also since the circles $A_{i}^{*} A_{i+1}^{*} I$ are of the same radii, we have $P_{1}^{*} P_{2}^{*} \| B_{1}^{*} B_{2}^{*}$, hence $A_{1}^{*} A_{2}^{*} \|$ $B_{1}^{*} B_{2}^{*}$.
11. We will prove that the intersection $X$ of $P R$ and $Q S$ lies on the line $B C$. Notice that the points $P, Q, R, S$ belong to the circle with center $A T$. Consider the six points $A, S, R, T, P$, $Q$ that lie on a circle. Using Pascal's theorem with respect to the diagram

we get that the points $B, C$, and $X=P R \cap Q S$ are colinear.
12. First solution, using projective mappings. Let $A_{3}=A M \cap B C$ and $B_{3}=B M \cap A C$. Let $X$ be the other intersection point of the line $A_{1} A_{2}$ with the circumcircle $k$ of $\triangle A B C$. Let $X^{\prime}$ be the other intersection point of the line $B_{1} B_{2}$ with $k$. Consider the sequence of perspectivities

$$
A B C X \stackrel{A_{2}}{\pi} \quad A_{3} B C A_{1} \stackrel{M}{\pi} A B_{3} C B_{1} \stackrel{B_{2}}{\pi} A B C X^{\prime}
$$

which has three fixed points $A, B, C$, hence $X=X^{\prime}$. Analogously the line $C_{1} C_{2}$ contains $X$ and the problem is completely solved.
Second solution, using Pascal's theorem. Assume that the line $A_{1} A_{2}$ intersect the circumcircle of the trianlge $A B C$ at $A_{2}$ and $X$. Let $X B_{2} \cap A C=B_{1}^{\prime}$. Let us apply the Pascal's theorem on the points $A, B, C, A_{2}, B_{2}, X$ according the diagram:

It follows that the points $A_{1}, B_{1}^{\prime}$, and $M$ are colinear. Hence $B_{1}^{\prime} \in A_{1} M$. According to the definition of the point $B_{1}^{\prime}$ we have $B_{1}^{\prime} \in A C$ hence $B_{1}^{\prime}=A_{1} M \cap A C=B_{1}$. The conclusion is that the points $X, B_{1}, B_{2}$ are colinear. Analogously we prove that the points $X, C_{1}, C_{2}$ are colinear, hence the lines $A_{1} A_{2}, B_{1} B_{2}, C_{1} C_{2}$ intersect at $X$ that belongs to the circumcircle of the triangle $A B C$.
13. It is well known (from the theory of pedal triangles) that pedal triangles corresponding to the isogonally conjugated points have the common circumcircle, so called pedal circle of the points $P$ and $Q$. The center of that circle which is at the same time the midpoint of $P Q$ will be denoted by $R$. Let $P_{1}^{\prime}=P P_{1} \cap Q_{1} R$ and $P_{2}^{\prime}=P P_{2} \cap Q_{2} R$ (the points $P_{1}^{\prime}$ and $P_{2}^{\prime}$ belong to the pedal circle of the point $P$, as point on the same diameters as $Q_{1}$ and $Q_{2}$ respectively). Using the Pascal's theorem on the points $Q_{1}, P_{2}, P_{2}^{\prime}, Q_{2}, P_{1}, P_{1}^{\prime}$ in the order shown by the diagram

we get that the points $P, R, X_{1}$ are colinear or $X_{1} \in P Q$. Analogously the points $X_{2}, X_{3}$ belong to the line $P Q$.
14. Let us recall the statement according to which the circle $l$ is invariant under the inversion with respect to the circle $k$ if and only if $l=k$ or $l \perp k$.
Since the point $M$ belongs to the polar of the point $A$ with respect to $k$ we have $\angle M A^{*} A=$ $90^{\circ}$ where $A^{*}=\psi_{l}(A)$. Therefore $A^{*} \in l$ where $l$ is the circle with the radius $A M$. Analogously $M^{*} \in l$. However from $A \in l$ we get $A^{*} \in l^{*} ; A^{*} \in l$ yields $A \in l^{*}$ (the inversion is inverse to itself) hence $\psi_{l}\left(A^{*}\right)=A$ ). Similarly we get $M \in l^{*}$ and $M^{*} \in l^{*}$. Notice that the circles $l$ and $l^{*}$ have the four common points $A, A^{*}, M, M^{*}$, which is exactly two too much. Hence $l=l^{*}$ and according to the statement mentioned at the beginning we conclude $l=k$ or $l \perp k$. The case $l=k$ can be easily eliminated, because the circle $l$ has the diameter $A M$, and $A M$ can't be the diameter of $k$ because $A$ and $M$ are conjugated to each other.

Thus $l \perp k$, q.e.d.
15. Let $J=K L \cap M N, R=l \cap M N, X_{\infty}=l \cap A M$. Since $M N$ is the polar of $A$ from $J \in M N$ we get $\mathcal{H}(K, L ; J, A)$. From $K L J A \xlongequal[\bar{\pi}]{M} P Q R X_{\infty}$ we also have $\mathcal{H}\left(P, Q ; R, X_{\infty}\right)$. This implies that $R$ is the midpoint of $P Q$.
16. Let $Q$ be the intersection point of the lines $A P$ and $B C$. Let $Q^{\prime}$ be the point of $B C$ such that the ray $A Q^{\prime}$ is isogonal to the ray $A Q$ in the triangle $A B C$. This exactly means that $\angle Q^{\prime} A C=\angle B A Q$ i $\angle B A Q^{\prime}=\angle Q A C$.
For an arbitrary point $X$ of the segment $B C$, the sine theorem applied to triangles $B A X$ and $X A C$ yields

$$
\frac{B X}{X C}=\frac{B X}{A X} \frac{A X}{X C}=\frac{\sin \angle B A X}{\sin \angle A B X} \frac{\sin \angle A C X}{\sin \angle X A C}=\frac{\sin \angle A C X}{\sin \angle A B X} \frac{\sin \angle B A X}{\sin \angle X A C}=\frac{A B}{A C} \frac{\sin \angle B A X}{\sin \angle X A C} .
$$

Applying this to $X=Q$ and $X=Q^{\prime}$ and multiplying together afterwards we get

$$
\begin{equation*}
\frac{B Q}{Q C} \frac{B Q^{\prime}}{Q^{\prime} C}=\frac{A B}{A C} \frac{\sin \angle B A Q}{\sin \angle Q A C} \frac{A B}{A C} \frac{\sin \angle B A Q^{\prime}}{\sin \angle Q^{\prime} A C}=\frac{A B^{2}}{A C^{2}} \tag{9}
\end{equation*}
$$

Hence if we prove $B Q / Q C=A B^{2} / A C^{2}$ we would immediately have $B Q^{\prime} / Q^{\prime} C=1$, making $Q^{\prime}$ the midpoint of $B C$. Then the line $A Q$ is isogonaly conjugated to the median, implying the required statement.

Since $P$ belongs to the polars of $B$ and $C$, then the points $B$ and $C$ belong to the polar of the point $P$, and we conclude that the polar of $P$ is precisely $B C$. Consider the intersection $D$ of the line $B C$ with the tangent to the circumcircle at $A$. Since the point $D$ belongs to the
polars of $A$ and $P, A P$ has to be the polar of $D$. Hence $\mathcal{H}(B, C ; D, Q)$. Let us now calculate the ratio $B D / D C$. Since the triangles $A B D$ and $C A D$ are similar we have $B D / A D=$ $A D / C D=A B / A C$. This implies $B D / C D=(B D / A D)(A D / C D)=A B^{2} / A C^{2}$. The relation $\mathcal{H}(B, C ; D, Q)$ implies $B Q / Q C=B D / D C=A B^{2} / A C^{2}$, which proves the statement.
17. The statement follows from the Brianchon's theorem applied to $A P B M C N$.
18. Applying the Brianchon's theorem to the hexagon $A M B C P D$ we get that the line $M P$ contains the intersection of $A B$ and $C D$. Analogously, applying the Brianchon's theorem to $A B N C D Q$ we get that $N Q$ contains the same point.
19. The Brokard's theorem claims that the polar of $F=A D \cap B C$ is the line $f=E O$. Since the polar of the point on the circle is equal to the tangent at that point we know that $K=a \cap d$, where $a$ and $d$ are polars of the points $A$ and $D$. Thus $k=A D$. Since $F \in A D=k$, we have $K \in f$ as well. Analogously we can prove that $L \in f$, hence the points $E, O, K, L$ all belong to $f$.
20. Let $G=A D \cap B C$. Let $k$ be the circumcircle of $A B C D$. Denote by $k_{1}$ and $k_{2}$ respectively the circumcircles of $\triangle A D F$ and $\triangle B C F$. Notice that $A D$ is the radical axis of the circles $k$ and $k_{1} ; B C$ the radical axis of $k$ and $k_{2}$; and $F H$ the radical axis of $k_{1}$ and $k_{2}$. According to the famous theorem these three radical axes intersect at one point $G$. In other words we have shown that the points $F, G, H$ are colinear.
Without loss of generality assume that $F$ is between $G$ and $H$ (alternatively, we could use the oriented angles). Using the inscribed quadrilaterals $A D F H$ and $B C F H$, we get $\angle D H F=$ $\angle D A F=\angle D A C$ and $\angle F H C=\angle F B C=\angle D B C$, hence $\angle D H C=\angle D H F+$ $\angle F H C=\angle D A C+\angle D B C=2 \angle D A C=\angle D O C$. Thus the points $D, C, H$, and $O$ lie on a circle. Similarly we prove that the points $A, B, H, O$ lie on a circle.

Denote by $k_{3}$ and $k_{4}$ respectively the circles circumscribed about the quadrilaterals $A B H O$ and $D C H O$. Notice that the line $A B$ is the radical axis of the circles $k$ and $k_{3}$. Simlarly $C D$ and $O H$, respectively, are those of the pairs of circles $\left(k, k_{2}\right)$ and $\left(k_{3}, k_{4}\right)$. Thus these lines have to intersect at one point, and that has to be $E$. This proves that the points $O, H$, and $E$ are colinear.
According to the Brocard's theorem we have $F H \perp O E$, which according to $F H=G H$ and $O E=H E$ in turn implies that $G H \perp H E$, q.e.d.
